POWDER-COATED FINISHES CATALOGUE

Airclos®
Aluminium Systems

RAL POWDER COATINGS

Our aluminium profiles are finished with a powder coating applied to the surface and cured in an oven, producing a uniform finish of high aesthetic quality, designed for seamless architectural integration.

The RAL powder coating range offers a wide variety of colours to suit the aesthetic requirements of each project, from neutral shades to more distinctive tones. This variety ensures greater coherence with the building envelope and precise integration of the system into the overall architectural design.

The finishes follow the process defined by Airclos to ensure consistency with the specified colour and finish.

Pricing is based on the selected colour and finish, as well as the quantity required.

SUPER DURABLE POWDER COATINGS

For demanding exterior architectural applications

Super durable coatings are designed for exterior projects where the finish plays a key role and lasting appearance is a priority. This range offers a wide variety of coating options and accommodates more technically complex finishes for demanding projects.

In suitable configurations, these coatings are selected to provide high weather resistance, excellent colour stability and superior aesthetic durability, along with enhanced corrosion protection.

As this range includes super durable and special finishes with a wide variety of options, pricing is provided individually according to the selected finish and quantity.

MANUFACTURER-SPECIFIC OR CUSTOM COATINGS

This category includes coatings from specific brands, selected by the client or specified for the project using the manufacturer's own colour chart, effects or finishing system.
As these are external references, they are subject to specific availability conditions, colour and effect validation, and supply coordination.

For this reason, each selection is managed individually to ensure consistency with the specification and confirm that the chosen finish is suitable for the system configuration and project scope.

Available upon individual quotation.

ANODISED FINISHES

An anodised finish is achieved through an electrochemical process that transforms the aluminium surface into a controlled oxide layer, integrated into the material itself.

This anodic layer must be properly sealed to ensure its properties are retained over time.

The process gives aluminium chemical and abrasion resistance.

The result is a finish with high resistance to weathering. Its understated appearance is well suited to architectural projects, offering a lasting finish that highlights the clean lines of the profiles.

We present the most common anodised finishes, but please contact us if you are looking for an option not shown here.

Please note that only matt finishes are available for roof structures.

This range of finishes is available upon consultation and individual quotation.

ALUMINIUM FOIL WRAPPING

Aluminium foil wrapping adds decorative finishes to the profiles in a variety of shades, textures and effects, expanding the system's aesthetic possibilities.

As these finishes are subject to availability and prior approval, their selection requires confirmation of the colour, effect and compatibility with the intended application.

For this reason, each option is managed individually to ensure consistency with the project specification and confirm that the chosen finish is suitable for the system configuration and intended application.

Available upon individual quotation.
